Release candidate v1.0.0-rc1 - not yet public

This fresh-history repository is being prepared for a computer-assisted preprint and exact reproducibility package for the proposed universal bound

$$\text{Vol}(K) \geq \frac{26220940089713\pi}{200000000000000} d^3 = 0.41187756378030227424817892598 \dots d^3$$

for every convex body K in $\mathbb{R}^3$ of constant width d .

The release candidate contains a standalone exact certificate, independent Python and base-R audits, adversarial rejection tests, and a lean Paper v1 manuscript reconciled automatically against the machine-readable certificate. Publication metadata is fixed for this candidate: Bruce J. Swihart is the sole named author, no institutional affiliation is asserted, prose is licensed CC BY 4.0, and software is licensed MIT. The canonical repository currently exists as a private staging repository at <https://github.com/swihart/minvol-degree3-contact-bound>. Three hosted jobs and a complete named-author fresh-clone replay passed on audited candidate commit `892d4bc6fad07950e78da66e45b95063a6415af6`. The final release date and tag, immutable assets, visibility change, and announcement remain pending.

Paper

- [Reference PDF](#)
- [LaTeX source](#)
- [Paper build and reconciliation guide](#)
- [Rendered paper-guide PDF](#)

The reference manuscript states the proof architecture and claim limitations in ten pages. Its certificate-critical constants and lower-branch partition are generated from the exact JSON rather than copied manually.

Publication metadata

- **Author:** Bruce J. Swihart
- **Institutional affiliation:** none asserted in this release candidate

- **Correspondence and verification reports:** the intended repository issue tracker at <https://github.com/swihart/minvol-degree3-contact-bound/issues>
- **Candidate version:** v1.0.0-rc1
- **Target final tag:** v1.0.0
- **Release date:** not yet assigned
- **License:** CC BY 4.0 for paper/prose; MIT for software/build infrastructure
- **Citation metadata:** [CITATION.cff](#)
- **Licensing text:** [LICENSE](#)

The repository description approved for the canonical repository is:

Paper, exact certificate, and reproducibility materials for a contact-geometric universal lower bound in the three-dimensional Blaschke-Lebesgue problem.

Remote release-candidate audit

The audited release-candidate commit is:

```
892d4bc6fad07950e78da66e45b95063a6415af6
Add release-candidate citation and licensing metadata
```

The hosted workflow at <https://github.com/swihart/minvol-degree3-contact-bound/actions/runs/35468019663> completed all three jobs successfully: exact/Python verification, independent base R, and paper/document build plus Poppler preflight. A separate fresh clone of that commit reproduced the complete Python and R replay under Python 3.14.7, NumPy 2.3.5, and R 4.6.1; rebuilt the ten-page paper and all 22 Markdown/PDF pairs; and ended with an empty `git status --short`.

The audit-transfer hashes and exact environment record are in [CLEAN_CLONE_CHECK.md](#) and [certificate/evidence/rc1_remote_audit.json](#). This is reproducibility evidence, not external mathematical review.

Reviewer path

1. Read the [paper PDF](#).
2. Read the [certificate status](#) and [certificate guide](#).
3. Verify the checksum manifests.
4. Run the exact and independent Python paths with `./run_python_checks.sh`.
5. With base R installed, run the complete replay with `./run_all.sh`.
6. Build the paper and Markdown documentation in a clean environment.

Replay

Install the pinned Python dependency:

```
python3 -m pip install -r requirements.txt
```

Run the exact verifier, binary64 audit, ten reconstruction tests, seven adversarial mutation tests, exact-constants and release-document checks, and paper/certificate reconciliation:

```
./run_python_checks.sh
```

Expected final markers include:

```
MINVOL UNIVERSAL CONTACT-BOUND CERTIFICATE: EXACT
MINVOL UNIVERSAL CONTACT-BOUND BINARY64 AUDIT: PASS
MINVOL ADVERSARIAL MUTATION SUITE: PASS
MINVOL EXACT-CONSTANTS APPENDIX: CURRENT
MINVOL REMOTE-EVIDENCE CHECK: PASS
MINVOL RELEASE-DOCUMENT CHECK: PASS
MINVOL CITATION METADATA CHECK: PASS
MINVOL METADATA PREFLIGHT: PASS
MINVOL PAPER-CERTIFICATE RECONCILIATION: PASS
```

With base R installed, run all language paths:

```
./run_all.sh
```

To refresh the archived base-R transcript deliberately:

```
./run_r_checks.sh 2>&1 | tee certificate/transcripts/base_r_audit.txt
```

After changing a protected source, transcript, or reference artifact, refresh and verify the checksum manifests:

```
python3 refresh_checksums.py
```

```
python3 refresh_checksums.py --check
```

Build documentation

Build the paper without overwriting its committed reference PDF:

```
./build_paper.sh
```

Build local PDFs for every Markdown source under `build/markdown/`:

```
./build_markdown_pdfs.sh
```

The committed Markdown/PDF pairs are under `rendered/markdown/`. Their pairing and PDF preflight checks are run by continuous integration and can also be run locally.

Proof architecture

The proof splits the normalized circumradius interval at

$$R_* = \frac{305695601}{500000000} = 0.611391202.$$

Below the split, a gap-free exact radial-propagation certificate has unique bottleneck 03B02. Above the split, four balanced circumsphere contacts force a 98,306-ray polyhedral core. An exact determinant transfer, a dominant-edge coordinate-width estimate, and three optimized antipodal cap pairs produce a near-Jung lower bound strictly above the bottleneck. Exact integer and rational arithmetic supplies the finite proof authority; binary64 Python and base R are independent audits.

Documentation

The editable sources are Markdown. Checksummed reference PDFs mirror the same repository-relative tree under `rendered/markdown/`.

Citation and license

Use [CITATION.cff](#) for the preferred preprint citation. The paper and prose documentation are licensed under CC BY 4.0; software and build infrastructure are licensed under MIT. See [LICENSE](#) for the full split-license notice.

Scope

The package proposes a universal lower bound. It does not identify a minimizing body, prove sharpness or equality, or prove the Meissner conjecture. The Meissner value is an explicit-body comparison value, not a universal minimum proved here. The result has not been externally reproduced or peer reviewed. The release candidate has been pushed only to a private staging repository; there is no public release, immutable tag, or publication claim yet.

The earlier public MinVol spectral announcement remains a separate repository: [swihart/minvol-degree3-spectral-bound](#). Further universal refinements are under investigation but are outside this v1 package.
